This REALLY needs fixing. If it weren't so late right now I might have written a filter that takes a tarball and sanitizes the permissions. I've got good reasons for compiling the kernel as root (when in the make, install, reboot, test loop it's quite a timesaver).

Isn't it just an extra ten seconds to type the 'sudo' in front of 'make modules_install' and enter your password? I guess I totally don't get it.

Matt
