Hello everyone (yes, i´m new at this list, just correct me if i´m wrong),

I have some trouble with /proc/net/tcp and tcp6  
I´m not sure if it?s a feature or a bug or maybe some cleanup of the cache...

A long time After a connection has been established the information about the process name and the pid itself gets lost, just a - appears.  
My own network-monitoring tool uses netstat to get some information about the network-connections. But without the pid I can't see (I could over a few more corners but ... crap) if there are more programs at the same pid or even which program it is (maybe an undetected Trojan or just an user with more connections then allowed...)

Here's a link to the netstat output

<http://netstat.root24.eu/netstat.php?dump=1>

And to my connection-statistics (the red colored hosts/ips have no special meaning/ just shows unresolved/new connections)

<http://netstat.root24.eu/connmon.php>

Normal there is a Pid and prog name in every line... since the server is online for about a month and some connections are even so long you can see some 'holes'

Greetings

Jörg
