David Sterba wrote:

Hi,

I'm submitting driver for IPWireless PC Card, used for 4G internet connection.

The driver has been in -mm series as ipwireless_cs.git tree for some time, is actively used and there are currently no outstanding bugs.

I'd like to let the driver pass through LKML and then let it queue for 2.6.25.

Driver is released under GPL, original authorship belongs to Symmetric co. Jiri Kosina has fixed some bugs and made it work with recent kernels, and I work on improving the code to match linux kernel standards.

When merged, please drop ipwireless_cs.git tree from -mm and include the patch instead. Patches should be sent to me and I'll push them to mainline via Jeff Garzik's driver tree, if there's no objection.

Driver lives in drivers/char/pcmcia directory, it's a serial driver. I'm not sure if this is the right place, since it's a networking driver too and therefore should be in drivers/net/pcmcia.

There will be a wiki with info for users and developers, todo etc.

If the -main- purpose of the hardware is wireless, it should go in via John Linville, wireless maintainer...

Jeff
