Wii, isn't this fun...! This is a resubmission of yesterday's patches based on the x86.git/latest tree. Yes, it _is_ a maze of twisty little passages. ;-)

just to make patch dependencies clear: most of the patches here can be applied to their base trees as-is, without depending on any other patch, correct?

the only undeclared dependency i found was the cpumask_scnprintf_len() patch – please prominently list dependencies in the changelog like this:

[this patch depends on "cpumask: Add cpumask_scnprintf_len function"]
