Hi,

Hi,

I'm using the latest Debian 2.6.25-rc7 kernel [0] and I have big troubles with hibernation. With this version, the hibernation (suspend on disk) is sometimes not resuming correctly. The only thing I get is a blinking cursor at the top-left of the screen. The problem is that it is not easily reproducible : sometimes it works, sometimes not.

AFAIK, 2.6.24 is not affected, but 2.6.25-rc6 and -rc7 (at least) are.

I'm using a Dell Latitude D630. (lspci attached).

Attached are a 2.6.25-rc7 and a 2.6.24 dmesg's after two successful hibernate/resume cycles.

Could you please check if the problem is still present if you boot with `acpi_new_pts_ordering` kernel command line argument?

Thanks,
Rafael
