Attached are a 2.6.25-rc7
and a 2.6.24 dmesg's after
two successful
hibernate/resume cycles.

Could you please check if the problem is
still present if you boot
with `acpi_new_pts_ordering` kernel
command line argument?

By the way, I just added `acp_new_pts_ordering` at the end of
the Grub
line beginning by "`linux (hd0,1)/vmlinuz(...)`". Is that
correct ?

seems strange you should add it to the `kopt` line and then kick as root
`update-grub`

```
# kopt=root=/dev/sda1 ro  
it should land  
kernel /boot/vmlinuz-2.6.25-rc7-amd64 root=/dev/sda1 ro
```

Well... I'm using Grub2 (`grub-pc`). I altered the boot option at boot time
but forgot to check `/proc/cmdline`. Will try again and report back.

Regards,

Didier

Hi,

I tried again and ensured that /proc/cmdline 's end was
acpi_new_pts_ordering . It did work for 2-3 hibernation, but then failed.

Regards,

Didier
