I am working on a project where I need to have linux setup with two monitors. I have had no problem getting the system configured so I can see the desktop on both monitors.

What the machine really needs to do is have one screen with a desktop (normal) and another screen that only displays a Java application (swing window). I don't want the java window to have any menus/buttons/borders etc. The second window will not need standard out/err or a mouse input.

Anyone have suggestions on how to do this? Is there a way to run a different windows manager on the two different screens.
