I have Red Hat 9 installed in ext3 file systems.

I have read that Red Hat, from version 7 or 8 fully supports LFS, as well as ext3 file systems. Is this correct? Does the kernel I have (2.4.20) which is up2date via Red Hat Network, have LFS support enabled by default? I searched in the kernel (via make menuconfig) the LFS support and I didn't find it... where is it?

Thanks

Herbert
