I am new to Linux, from an XP background, so please help if you can. I need to upgrade my apache from an older version to httpd-2.0.47. But I am wondering if I need to uninstall the older version and if so what's the best way of doing so. Can I just download the version from apach site and then run ./configure, make and make install? Or do I need to use up2date.

Please note that I've never used up2date, or installed anything from rpm, being new to Linux, which is why I prefer to do a direct install.

I'd really appreciate you input.

thanks in advance
