Anyone with AcroRead experience, this one's for you!

I got a friend, really I do, who uses AcroRead to view PDF's in RH9. He opened a file to view and resized it to make it bigger. Problem is he resized it over the boundaries of his view space. So now he can't resize it down so whenever he opens a file in AcroRead now, he can't min it, max it, move it, etc. If he opens a second file in AcroRead, it shows up normal. Is there a way to fix the configuration so that whenever he opens up a file in AcroRead, it will not default first to the huge screen he accidentally set.

My first suggestion was to change his resolution to bigger, resize it back down, and then go back to the original resolution and see what happens. Is this viable, u think?

Thanks in advance!
