Hi all,

I am running an up2date 7.3 server with apache 1.3.27 on it. It appears mod_auth_digest isn't available. I need to use auth_digest for people who access their home directories via ~username.

According to the apache docs, mod_auth_digest is supposed to be in versions after 1.3.8. mod_digest is there but not mod_auth_digest.

Does any one use mod_auth_digest and if so is it with 1.3.x of the server? If so how do I get in there? I've looked at the DSO information and I'd like to jsut be able to drop the module in and edit the conf file and go.

Also, is auth_digest a secure way to authorize access to home directories?

Any help appreciated.

Mike
