I have no clue what happened. I updated (via up2date) glibc stuff. I've been having some odd delay problems with the network connection lately, specifically apache (all I run is apache, DNS and sshd right now), so I rebooted my machine and the X display won't come up.

It asks me to try and fix it via root password, so I do that and it goes off into never-never land (black screen) and never returns.

Any ideas?

I tried running `redhat-config-xfree86 --reconfig` but I get the following:

\* ddcprobe returned bogus values:

ID: None

Name: None

HorizSync: None

VertSync: None

Trying with card: S3 Trio64 (generic)

Xlib: extension "RENDER" missing on display "localhost:10.0".

Im doing this over an xhost connection onto another machine of mine, I get a display showing me my resolution and color depths, I say OK then it says you must restart your server...so I reboot but same results.

Im using RH 9.0, Samsung Syncmaster 4NE with a S3 Trio card (old).

Secondly, not sure if this is related, but I run the command:

```
find / \( -nouser -o -nogroup \) -print
```

to see if any files are not owned by someone. I keep seeing files that have no owner or no group ownership, just numbers that don't exist in `/etc/passwd` or `/etc/group`

## RedHat: X problem

Im running a tight IPTables on my machine with 2.4.22 kernel

Any help is much appreciated!

Jeff
