If you need to block the access to that sites locally (i.e. from the computer on which you run iptables, you can use the following command:

```
iptables -A OUTPUT -d <XXX_site_IP_address> -j REJECT
```

alternatively, you can add the following string to /etc/sysconfig/iptables (in the 'filter' table):

```
-A OUTPUT -d <XXX_site_IP_address> -j REJECT
```

If you want to block the access from another machine, for which your computer is acting as a router, you should change 'OUTPUT' to 'FORWARD' in the examples above.
