Hello folks..., A few weeks ago I change from RedHat 7.3 to RedHat 9 in my server. This computer establish a conection to internet using an ADSL through squid like a proxy and iptables like a firewall. But there are some applications no working in others computers with "windows me", like kazaam or the view cameras option in the messengers (yahoo and msn). This options works very well with redhat 7.3 in the server but no works in the redhat 9.

I would use both applications, squid and iptables or I would use only one of them?

How can I resolve this problem?
