(It seems this message didn't make it to the list. A very quiet second christmas day, at least in my mail box.)

Hi,

I didn't notice this before, but since my shift from 7.3 to 9 it appears that the htdig search.html page is taken from the directory `/usr/share/htdig` when I issue <http://server/htdig/search.html>. This did not happen on 7.3. The templates used in a search however are taken from the correct directory, ie `<DocumentRoot>/htdig`.

Anybody noticed this as well? Funny thing is that even setting an Alias `/htdig/ "/data/www/html/htdig/"` doesn't solve the issue. Am I missing something obvious?

Bye,

Leonard.
