Hello folks, I have a RedHat 9 installed in my computer. This machine have the ip adress 192.168.0.1 on eth0 (I have only one net card), but when execute the "route" command I see two net adress on this eth0 (192.168.0.0/255.255.255.0 and 169.254.0.0/255.255.0.0). I have some problems with the file transfers between this computer and others in the net and I think the problem is this two net adress on the eth0. I try to delete the net 169.254.0.0 from the ip routes:

```
#route del -net 169.254.0.0
```

but the command respond with the error: this process is not running.... etc., etc., etc.....

How can fix this problem?

=====

Saludos desde México
