I just upgraded my systems to 2.4.20–27.9. One of the systems requires the kernel source to be installed (Inspiron 8500 network card needs to have driver compiled against the kernel). When I run the rpm command, it shows that it is installing it. However, after it completes and I try to verify the source, there is nothing there (There is no linux src under /usr/src). I have tried "rpm -ivh" and "rpm -Fvh". In the past I have not had issues with this. Anyone have any insight? Any help appreciated.

Thanks.

–Jim
