Hello everyone.

I'm running a test samba server (2.2.8a) and was doing some testing here.  
(RH 8.0 box)

One thing I wanted to test was the ability to have Windows shares automounted if the sambaserver was rebooted for some reason.

Currently, I have a NT 4.0 server setup and with a couple of shares.

What is the best way to have shares automounted on a reboot? Is there a link some where that shows how to do this? I've been stumped on doing this.

I appreciate the help.

J.
