I have been unsuccessfully trying to use my Motorola v60c cell phone as a modem attached to my Redhat 9 laptop (via a USB cable), to properly dial, connect and logon to a remote Redhat 9 Server. I have reviewed web notes of other peoples attempts to do this, and one person even claims that this is supported by 'out of the box' Redhat. When I plug my phone into the USB port on the laptop, I get the following messages in /var/log/messages:

```
hub.c: new USB device 00:0c:0-1, assigned address 2
usb.c: USB device 2 (vend/prod 0x22b8/0x5) is not claimed by any active driver
/etc/hotplug/usb.agent ... no modules for USB product 22b8/5/1
```

Then, when I use 'cu -l' with various device names (such as ttyUSB0, ttyACM0, ttyS0, etc), I cannot get a connection. Can anyone help???

Thanks,
bdavis
