I'm running into a problem getting X-Windows to run with a decent resolution on a Dell GX 270 with the Intel 865 Graphics Cards (64 MB video ram). I have seen messages regarding the BIOS revision and tried flashing the BIOS with A02 and A01 with no luck. Right now, I have 3 machines (all identical) with one BIOS being A01, another A02, and the third A03.

I can only get 1024x768 with 8 bit color depth running. Anything higher gives the error "No Video BIOS modes for chosen depth". I'm running Enterprise Workstation v3. Does anyone know how to fix this?
