First, I apologize for immediatly subscribing to this list and then emailing it, not really knowing if this is the appropriate place. However, I am kind of desperate for some help and this was the best bet I could find. I am running two machines with RedHat 9.0. Both of them will log out an idle user after 131 seconds. This is less then helpful, as I tend to login to a machine via SSH and move between windows. Also, it will even log out a SCP or FTP connection. For the life of me I cannot find where I can increase (or remove) this idle timeout. If anyone can point me in some direction, it would be really helpful.

Thanks

Kevin Goddard
