Hello all,

I just installed Red Hat Enterprise Linux WS on a Dell 650 Precision Workstation 2Ghz. I am having some troubles with sound. Basically, I only hear the system sound that is generated not by the sound card. When I run the sound card configuration tool, it does indeed play the test sound. But, I am not getting sound anywhere else. When I sign in from the GUI sign in, there should be some sound, yeah? I have Yellow Dog on my MAC, which has a very similar log in screen, and it plays some sound during that KDE launch process from the sign in screen. Also, trying to play CDs: they mount and the players (KsCD and the regular "Media Player") both seem like they are playing the CD, but no sound. Also, the cddb does not actually download the song names for something as basic as Black Sabbath Paranoid. So, seems like something ain't working right.

I've had to go through all sorts of processes to configure a wacom tablet and a variety of other things, so am comfortable looking at the XFConfig file, /var/log/messages etc, so if you have any idea of what I should take a look at or try, any comments or help is greatly appreciated.

Loving it otherwise.

Best,

-Matt
