Hi Ben!

In /etc/vsftpd/vsftpd.conf specify
chroot_local_user=YES

and comment

#anonymous_enable=YES

Then to bind user to his home directory

In /etc/passwd

mosherben:x:800:800::/var/www:/bin/bash

pectabyte:x:801:801::/var/www/pectaybte:/bin/bash

Then in the bash execute

chmod 777 -R /var/www/pectaybte

chown pectabyte:pectabyte -R /var/www/pectaybte

that's it

Best Regards,

Sergei Giritch

Subject: FTP server

Hi,

ok I installed the vsftpd which came with RH9. Anyhows I know the config file is in /etc/vsftpd/vsftpd.conf but how do I configure it to be multi-users with no anonymous access. This is only for a friend and myself to use. I have created our usernames and passwords but how to choose what directories we have access to?

RE: FTP server

RedHat: RE: FTP server

I want my account (mosherben) to access /var/www/ for complete control of the FTP server and service so I can change the permissions of a subfolder using an FTP client if I dont like something I see in one of the folders.

I want my friends account (pectabyte) to access /var/www/pectaybte to control his area of the FTP service.

Both accounts need full permissions (7). Can someone help me figure the configuration out?

Thanks,
Ben

PS: I havnt updated any packages yet using up2date before someone asks.
