

getting two directories to be the same

To: redhat-list@redhat.com

I am doing backups of a remote server by mounting the remote server using NFS. I am now running into the same problem that I was having trying different ftp programs to mirror it. The problem is deleting files on the backup server that are not on the remote server. There is not ssh access to the remote server and the ftp daemon on the remote server sucks to say the least. Anyway, I have the remote server NFS'd to the local (backup) server. Is there an easy way to mirror the directory recursively from the nfs drive to the local drive? I NEVER want to delete anything from the NFS'd drive.

Thanks

Steve
