

Syncing Linux FS to Windows

To: "General Red Hat Linux discussion list" <redhat-list@redhat.com>

At work I have my XP Pro box that works fine complete with my personal My Documents folder and all is controlled by a 2000 Domain Controller running Active Directory. We have three T1's at work.

At home I've got a few Windows boxes controlled by my Linux box using Samba. All the Windows boxes think that the Linux box is a NT server and Windows is quite happy with the roaming profiles that I've setup and remote shares. I have a cable modem at home pull an average of 4MB down.

What I want to be able to do is sync My Documents from the Windows box at work onto the Linux box at home on an hourly bi-daily basis. Of course to get all the data home initially I could create a zip file but then to keep everything updated is another story.

What would you guys recommend for this? And of course I have full access to the network at work from home.

Thanks,

-brian
