Hello,

I am installing RH E3 on a Dell 2650. I have an Apple Fibre Channel card (LSI) installed and connected to an Apple Xserve RAID unit (configured as RAID5 volume). The server also has an embedded RAID controller which controls 2 internal SCSI disks (these are configured as a mirror set).

Everything is auto-detected properly, and the RAID sets are visible in Disk Druid. My problem has to do with the device mappings. When I go into Disk Druid to make partitions during the setup, the RAID5 volume (the Xserve RAID) is mapped to /dev/sda and the mirror set (internal SCSI disks) are mapped to /dev/sdb. I want to install the OS on the internal mirror set, so is there a way to reverse this?

Thanks!
