I have a curious problem. The other day my amanda backup process failed because I forgot to change tapes. No problem, this has happened before. because I dump to disk, then tape from disk to tape, my /var/tmp directory has a <date>/<host>/_<disk>.1 files and it jsut so happens, I need access to those files right now.

My amanda configuration does an uncompress tar of these disks for this particular configuration. Is there any way to get the data out of these files directly?

Wayner
