To: redhat <redhat-list@redhat.com>

I have installed a us robotics modem.

When I try to run minicom, it does not recognise the modem and also says that it is not installed. This is not very serious. I can live without minicom.

The serious thing is that when I wish to install it thru network devices, the system refuses to recognise the modem.

On the other hand, when I run kppp, it not only recognises the modem but also dials it and I can surf the Internet.

Could someone tell why the system cannot pick up my modem, while kppp does it successfully. Also, what should I do to configure it thru network devices.

I am using Redhat 9.0.

Thanks
shiraz
