Hi,

I am facing a problem in configuring a Sendmail and DNS servers with a ADSL line.

1).How can I config (edit the sendmail.cf file and other files like hosts, network, reslove.conf, ifcfg-eth*) the mail server having with ADSL (Dynamic IP) line to work with my other seperately loacted DNS server(having static IP).

2).How can I config (edit the sendmail.cf file, Zone files and other files like hosts, network, reslove.conf, ifcfg-eth*) the mail server and DNS server having with ADSL (Dynamic IP) in same location itself.

Can somebody answer me in little bit expressive way please.

Thanks,
Lasantha Amarasinghe
Sri Lanka
