I'd recently downloaded the RPM from the RedHat;s ftp site. My internet connection is slow and cant handle the files with large size. Now i want to know that how to create a installation cd from the downloaded rpms and other files like dosutils, boot.iso.

I tried to make a bootable cd by using ans iso editor. First I opened the boot.iso then added all the files and folders leaving the isolinux, as it automatically comes there from boot.iso. and when i birnt the cd and booted the computer from the cd, after booting, it asks for the installation mthed.

I selected local cd rom but it fails as it cannot find the files and shows that it is unable to locate the installatio n files. please tell me how to

create a cd which will start installing linux after pressing <enter> on the windows where it ask for the installation method as text based or graphical.

I want to make my cds as same as the cd burnt with the ISOs. please help me and tell me in detail that where to copy files and what to do after that.

Any help from any one will be Appreciated.

Thankyou

Yours sincerely

Aman Singh
