The new server that I built has a 754 AMD Sempron along with a Biostart motherboard. I installed RHEL AS v.4 on it last night and during the initial install process it says that it couldn't locate something and it was going to assume that it was going to run at 33Mhz FSB. Seeing that it spit out a bunch of things before it goes to the graphical interface for the install I couldn't really see what the reason was for making it go at such a slow speed. Is there a way that I can check to see if its still running at that speed and if it is, how do I correct it?

Thanks,  
Jason

According to what you wrote,maybe you can get the exact error message for us by press "CTRL+ALT+F3" or "CTRL+ALT+F4" .sorry  
I can't remember clearly.~~~
