Jason,

Do you still have the command (and command output) you used to create the filesystem?

```
fsck /dev/sdb  
( deleted old partition, created new partition, wrote and exited)
```

```
mkfs.ext3 /dev/sdb1
```

```
mkdir /san
```

```
mount -text3 /dev/sdb1 /san
```

Does SANsurfer report any errors?

Not using it, not really relevant that I can see. Again, the LUN works fine when mounted. The OS is simply failing to mount it from fstab during boot. (mount -a works fine afterwards)

Thanks,
