Hi Tanguy,

Redhat's PAM does some changes on the fstab-file... dependig on the account which is logging on first... perhapes the diff's occure therefor.

What happens to your system – does it work? Are there strange infos in the /var/log/messages...?!?

cu,
Joe

Gents,

I was recommended to use mondo to backup my RHEL4 running LVM. I have successfully created an ISO image which I burned onto a DVD. Unfortunately when booting the PC with the DVD, and running a compare, mondo reported 26 file differences, mostly files like fstab that I think are updated dynamically by the system, which therefore cannot be backed up correctly.

I am asking you guys if I can ignore those differences or if I need to boot the server with a mondo disk to create a mondoarchive to ensure the system is not mounted.

Thanks–
Tanguy
