Hi Mike,

Thank you for your reply.

It is true that we can edit the fax file with GIMP or other image editor as I wrote in my first post. However, due to my limited user experience, I cannot edit a multi-page fax file in GIMP. Considering the situation, I receive a fax file via Hylafax and I want to remove the fax number shown on each fax page. With "Imaging for Windows", I can use the annotation tool to coat the fax number in white and repeat the action on multiple fax pages; but I don't know how to do the same thing in the linux environment. Hence, welcome any idea or comment to this question.

Thank you once more, Mike.

Michael

"Imaging for Windows" is just an image editor, like The Gimp, though not nearly as full featured. If The Gimp is to much for what you want to do, have you tried searching for another image editor?

Re: a fax viewer for linux similar to "Imaging for Windows"

Hi Robert,

Thank you for your response. However, my question is not how to view a fax file, but how to make an annotation on the fax file directly even with a multi-page fax file. Hence, as you say, there are many viewer available on linux platform to view the fax file; but I cannot find one that can make an annotation as easily as "Imaging for Windows".

Thank you.

Michael
