Dear All,

I am using dual xeon machine loaded with RedHat-AS-4 (2.6.9-5) and maid RAID-0 with adaptech scci HDD and I am happY with that.

Now I need to upgrade the OS to update 3 (2.6.9.34) and manually update the latest security patched kernel-2.6.9.34.0.1.

Issue: 0

The scci RAID driver disk for adaptec (A3200) which I used for 2.6.9-5 is not supported for the Update-3. I could find the driver form the distro but its not doing the right thing.

So I visited the adaptech site and found and download the driver the driver a320raid.rhel4qu3.i686.[RPM and img]

Q0. How can I pass the .img file to FLOPPY from both linux and windows ?

Q1. How can I pass the .img file to CD-ROM from both linux and windows?

Q2. What would be the use of that RMP package which came along with that driver bundle ?

In Advance Thanks for any input or suggestions.

Thank you,
