Try Mondorescue...

<http://www.mondorescue.org/>

Make sure to run image with compare mode or better yet perform test restore.... Mondo works pretty good but I had to play with mondoarchive options for certain hardware/OS combinations. Mondo runs live from running distro, RHEL4.

Are you trying to create backup image or clone a drive? It's always best to use latest/greatest distro for "newer" hardware like SATA. SATA controller support will vary greatly between distro and distro versions. The problem you are encountering is the SATA controller on the ML150 is not supported on Knoppix 3.9 and Ubuntu 5.10. Verify if controller is supported on newer versions....or switch to LiveCD distro which support that SATA controller. Try Ubuntu 6.06 or Knoppix 4.x...

BTW, I have cloned RHEL 3 drive running live with "rsync -ax" see here for details with knoppix session...

Subject: SATA Driver Image Partition

Hi, I've a problem trying to make a Partition Image.

I've a Red Hat EL 4 / HP ML150 - 2 HD Maxtor Serial ATA - 1 Gb RAM

I test different software but anyone recognize the HD, Tested Gparted /Partimage / QTParted. I try other distros like Knoppix 3.9 and Ubuntu 5.10.

RE: SATA Driver Image Partition

Could someone give me a clue ?

Thanks
