Did you add a default gateway:

```
route add default gw <ip address of gateway>
```

And make sure you let your firewall send dns traffic through if you are handing your internal clients dns servers from outside your internal lan.

Hi all,
I ahave configure linux to act as a router. I have set up the iptables and forwarding and the DHCP server. when I ping an a public IP address such as 68.x.x.x for yahoo, I am able to ping. However, when I ping a domain name such as www.yahoo.com, I cannot ping. How can I have the IP address to resolve to a domain name.

Regards,

Omar
