Hi I am experiencing a Kernel panic problem. Please help...

It is Redhat 7.2 Linux with kernel 2.4.7-10.

First I got a Journal Superblock error and mount error 22, so I used Linux Rescue in installation CD, ran e2fsck /dev/hda2, fixed and cleared all errors until hda2 was clean.

After I reboot it, I have another error:  
pivotroot: pivot\_root (/sysroot, /sysroot/initrd) failed: 2  
Freeing unused kernel memory: 220K freed  
Kernel panic Kernal Panic: No init found. Try passing init= option to kernel.

Here is the file system  
/dev/hda1 \* 1 7 52888+ 83 Linux  
/dev/hda2 8 742 5556600 83 Linux  
/dev/hda3 743 776 257040 82 Linux swap

What should I do next?

Thanks,  
JW
