I don't think he needs to reinstall grub (in fact on redhat 7.2 it might even be lilo) since his kernel is loaded otherwise wouldn't give a message about being unable to find init.

Hi I am experiencing a Kernel panic problem. Please help...

It is Redhat 7.2 Linux with kernel 2.4.7-10.

First I got a Journal Superblock error and mount error 22, so I used Linux Rescue in installation CD, ran `e2fsck /dev/hda2`, fixed and cleared all errors until hda2 was clean.

After I reboot it, I have another error:
pivotroot: pivot_root (/sysroot, /sysroot/initrd) failed: 2
Freeing unused kernel memory: 220K freed
Kernel panic Kernel Panic: No init found. Try passing `init=` option to kernel.

Here is the file system
`/dev/hda1 * 1 7 52888+ 83 Linux`
`/dev/hda2 8 742 5556600 83 Linux`
`/dev/hda3 743 776 257040 82 Linux swap`

What should I do next?

Thanks,
JW
