I've had similar problems, the checksums seemed to fail even when the md5sum didn't.

Being neurotic I've extracted all the iso's into one folder then "rpm --import"ed the key on the disk and verified every package "rpm -K blah.rpm". They were all correct so I just exported the files through nfs (http works just as well) and use the isolinux on the first disk to create a disk to boot from.

End result: quick(it's often quicker than cd/dvd installs) working install.

Hope this helps.

Best regards,

John.

I have downloaded years of Fedora and RedHat isos, written them to disc and used them for installations.

I have not been able to write FC 5 disc2 and disc5, RedHat ES 4, Update disc2 and disc4 successfully. They all fail the installation test prior to starting the installation. I have checked the sha1sums for the isos that I have. They are fine.

Any suggestions as to why the installation tests are failing.

Installing on Dell Optiplex 620s. I have successfully done this before with a previous version of RedHat
