As far as I can tell, up2date only speaks the old version of Yum, where you created the repository with 'yum-arch'. However, many yum repositories are the new-style 'createrepo' type; up2date gets a 404 error when it looks for the 'headers' directory, since it doesn't exist. Is it possible to make up2date speak to these newer repositories, or will I need to find a different workaround?

As far as I know, you can't. I tried to use up2date on Fedora Core 5 (where it was deprecated) and tried to configure client for newstyle yum repo, even tried to create my own header files without a luck. I just gave up and started to use yum.
