Hye, I work actually under red hat, with apache 1.3.28 & PHP 4.3.2...but I have to use the IMAP lib... httpd -l list me the imap module, but not activated.

I got these 2 files ::

Code:

```
/home/user1/.../apache1.3.28/src/modules/standard/mod_imap.c  
/home/user1/.../apache1.3.28/src/modules/standard/mod_imap.o
```

So I launched the command :

```
"apxs -i -c mod_imap.c"
```

To get my file mod_imap.so, and added these 2 lines to httpd.conf :

```
LoadModule imap_module "/lib/modules/mod_imap.so" AddModule "mod_imap.c"
```

But after xwhen I do a apachectl" to check the httpd.conf, I got this error message :

Code:

```
[ERROR] : cannot remove module mod_imap.c not found in module list.
```

Anyone know what's wrong ? or how could I do to install IMAP lib on Apache correctly ? Thanks for help.
