Hello

We have successfully set up Red Hat Enterprise Linux ES4 and we are now trying to connect remote clients to connect to it.

The problems we are having are as follows:

a) TELNET

If we connect with telnet, we get the login prompt. We use any valid login name & password combination (including root), we get the response "Login incorrect" and then the login prompt repeats. How can we allow remote telnet connections? We know telnet is strongly not recommend because of security reasons. However, we still want o know what is prevent the telnet connections. BTW, the telnet service is running and the iptables services is not running.

b) SSH

If we connect with SSH, we can log in with "root". However, we can not connect with any other account because it says "connection refused by server". How can we allow other users to connect with SSH. We have checked the sshd\_conf file but do not know exactly what setting would be causing this problem.

Regards,  
Georges Carraha
