Hi andy

edit the configuration file "/etc/X11/XF86config"

In this you can find the Horizontal Sync and Vertical Sync settings

change the value in the configuration according to your monitor setting

Precaution : X configuration should be done in run level 3 and to test it change to run level 5

I'm trying to use a flat-screen monitor (GNR TG700H) with RedHat 9. On boot-up it fails at the login screen stage with the message "out of frequency" – but when I boot into Windows XP it's fine! Is there a setting I can change to make it work with RH9, or is it a lost cause?

Andy
