I have a corrupt /bin/kill command and would like to replace it, but can't find the rpm that I need to reinstall. I downloaded the latest coreutils rpm and forced and install with that, but that didn't do it. Can somebody lead me into the right direction? I am running RHEL AS 4.4

```
# rpm -qf /bin/kill
util-linux-2.12a-16.EL4.20
```

Thank you and all that replied. After forcing an install of the rpm that I got from redhat, I now have 6 files that rkhunter reports as bad.

```
/bin/dmesg
/bin/kill
/bin/login
/bin/more
/bin/mount
/usr/bin/whereis
```

Any ideas? Is there something I did wrong or something I need to do with rkhunter? The only one reported bad before I did this was the /bin/kill. I installed the rpm by:
rpm -ivh --force util-linux-2.12a-16.EL4.20.i386.rpm

Thanks
Steve

I'd worry about being rootkited or having faulty hardware. With emphasis on the second.

Re: /bin/kill

Check your RAM. I'd bet there lies the problem.
