If you are thinking about a cluster with RedHat, you might look at

<http://www.rocksclusters.org/wordpress/>

This cluster of free software includes Ganglia, Grid, Sun Grid Engine, etc.

It has been recommended to me by the well-known vendor that is selling us a cluster of compute nodes.

I am trying to design a HA solution using the Redhat linux cluster suite with 2x Nodes running Apache with php custom apps.

I have some questions:

- What is the difference between Redhat cluster suite and other open source HA
- What is a cluster manager ?Is this the same as Cluster suite?
- Can I implement a server cluster using cluster suite without having a shared external disk if the services do not need to share the data?
- if i want to implement RHCS on 2x nodes to use the external storage, what are the requirmnts for the SAN switch and SAN storage in case i go for External .Fiber chaneel storage
- what about GFS license?
- If I want to use load balancing , can I use the RH cluster suite.
- Can some one guide me the minimum hardware requirement for the cluster suite?
- Am thinking as a second option to use Hardware Load balancer form juniper or cisco to resolve the issue of cluster.

any input really appreciated.
