Check out /etc/logrotate.d/ – There is an httpd log rotation file there.
You can learn more via "man logrotate".

Arpotu.

Ok, I found the documentation. However, there's one thing that it simply does not mention: is there any way to control *when* the logs are rotated, or is that simply x seconds after apache is started?

If so, I guess it's time for me to do a perl replacement for that....
