Hi, I have an RedHat enterprise linux machine. On which I have installed VnC free edition. I want to run VnC server with display:0 or Native display. When I run vncserver :0 it says VnC server is already running on display 0. When I try to locate that process using ps command I cannot find VnC process running. Assuming VnC is running on display:0 when I tries to connect from vncviewer I get an error msg unable to connect to host: connection refused (10061). How can I access the native display from the vncviewer? ANYbody any idea? -SK
