

NTFS filesystems

Greetings:

Does anyone know the status of things regarding mounting NTFS filesystems? My RHEL4 installation squawks at this as an unsupported FS (plugging in an external USB drive). I have been able to whack the factory partition and create a new ext3 filesystem on it, but I was hoping for interoperability, so I could recover files from a Windows PC if necessary.

My drive is a 750 GB model, and my kernel is 2.6.9. I thought NTFS had been supported for some time. Am I mistaken? If I am missing some other pieces for the kernel, how do I get them?

Scully
