

Ensuring SAN LUN persistent names after reboot...

Source: <http://linux.derkeiler.com/Mailing-Lists/RedHat/2007-11/msg00023.html>

Hello,

I have yet another SAN migration question. We're going to add many new SAN LUNs, which will end up being /dev/sdp-/dev/sdas. Once the new storage is built as md devices and added to LVM, we are going to release the old /dev/sdb-/dev/sdo devices.

My concern is that after a reboot, the new devices will rename themselves to /dev/sdb-/dev/sdae and it will break the md device pairing (and LVM). Is there any way to ensure that LUN names are persistent after a reboot?

Thanks,
Arpotu
